Zdalne sterowanie modeli latających, pływających, kołowych (Remote Control of Model Aircraft, Ships, and Wheeled Vehicles) Warsaw, Wyd-wo komunikacyjne, 1958. 279 p. 5,140 copies printed.

Reviewers: Jerzy Świdziński, Master of Engineering, and Adam Kosiarski;  
Ed.: Michał Goszczyński; Tech. Ed.: Leokadia Zvolakowska.

PURPOSE: This book is intended for instructors in radio engineering and in the construction and operation of models, as well as for model designers and advanced radio amateurs. It also may be useful to supervisors of physics workshops in schools and youth centers.

COVERAGE: The book contains a description of basic systems used in the remote control of various models for recreational purposes. The authors attempt to provide sufficient information for the reader to design, build and operate remote control systems for models. They outline the principles of operation of these systems and illustrate them with diagrams and drawings. Chapters II-B,

TITLE: The Adaptation of Electronic Strain-measuring Devices of the Type ID-2 in the Investigation of the Dynamic State of Stress of Machine Parts (Prisposobleniye elektronnykh izmeriteley deformatsii tipa ID-2 dlya issledovaniya dinamicheskoy napryazhennosti detaley mashin)

PERIODICAL: Nauch. tr. In-ta mashinoved. i s.-kh. mekhan. AN UkrSSR, 1955, Vol 5, pp 40-50

ABSTRACT: The ID-2 apparatus in conjunction with wire-resistance strain gages is used widely in the measurement of static deformations. A number of measures are proposed to effect the adaptation of this device to the measurement of dynamic deformations. A II-type filter network, passing without distortion frequencies ranging from 85 to 100 cps, is connected to the output of the demodulator stage of the device which operates at a carrier frequency of 850 cps. The filter network consists of two capacitors of 50 mf each and a choke with an inductance of approximately 0.0035 henry. An additional circuit is also

Card 1/3

SOV/124-57-3-3798

The Adaptation of Electronic Strain-measuring Devices of the Type ID-2 (cont.)

introduced which makes it possible to balance the reactance component of the arms of the bridge (phase corrector). Methods of preventing parasitic currents from being induced in the loop of the oscillograph are examined. These parasitic currents may occur as a result of the following conditions: 1) Nonidentical voltage-current characteristics of the selenium rectifiers of the ring-type demodulator; 2) unbalance of the reactance components of the arms of the bridge, and 3) the presence of harmonics of higher order in the carrier frequency supplied to the bridge. It is recommended that the rectifiers (selenium discs 18 mm in diameter) be carefully selected for identical voltage-current characteristics and that the demodulator be then balanced with the aid of a slide-wire potentiometer. This latter step should be performed with the control voltage source disconnected from the demodulator. The inner arms of the bridge must be double-wound. It is imperative that all ferrous screws be replaced with brass screws. The calibrating curve, presented together with the frequency characteristic of the modified device, shows that the mechanical process being investigated is transmitted without distortion up to a frequency of 70 cps and that the calibration curve is virtually linear at loads up to 500 kg/cm<sup>2</sup>. When employed in conjunction with a type-5 vibrator of an MPO-2 oscillograph and wire-resistance strain gages of 100 ohms, the sensitivity of the device constitutes approximately 15 kg/cm<sup>2</sup> per mm of recording. The

Card 2/3

SOV/124-57-3-3798

The Adaptation of Electronic Strain-measuring Devices of the Type ID-2 (cont.)

modification described may be accomplished without disturbing the original construction of the apparatus. The current for the ID-2 apparatus is supplied from two storage batteries; variations in battery voltage produce errors amounting to 1.2-1.5% for every percent of voltage variation. It is, therefore, essential that the device be operated within the horizontal portion of the battery discharge curve. A voltmeter provides a constant check on the voltage of the batteries. It is also recommended that the device be powered from an external source of alternating current of undistorted waveform. In investigating dynamic processes the galvanometer of the ID-2 device should be disconnected.

TITLE: Measuring Equipment for the Static Recording of the Stressed State of Articles (Izmeritel'nyye ustroystva dlya staticheskoy registratsii napryazhennosti detaley)

PERIODICAL: Nauch. tr. In-ta mashinoved. i s. -kh, mekhan. AN UkrSSR. 1955, Vol 5, pp 51-61

ABSTRACT: The analysis of the results of an experimental determination of the stressed state of any machine part over a sufficient prolonged period of time concludes in the sorting out of a large number of measured quantities according to their magnitudes and in the determination of the statistical distribution of the quantities that characterize the operating conditions of the part. The paper describes the operating principle of an electronic device for the automatic determination of the extremal values of the measured quantities. The input consists of an electric voltage which characterizes the measured parameter. The device automatically segregates the input voltages into six sub-ranges, which are equipped to transmit a signal to the

Card 1/2

124-57-2-2569

Measuring Equipment for the Static Recording of the Stressed State (cont.)

computing link, if an extremal value of the quantity will occur in the given sub-range. The computers of each sub-range count the number of values and upon completion of a test immediately provide an account of the number of the extremal values contained in the given sub-range. An example is adduced, showing the analysis of a generic curve and the determination of the maximal and minimal values thereof. The equipment described includes electromechanical computers capable of utilizing impulses lasting longer than 1/25 sec. It is possible, however, that computers, be used which are capable of utilizing impulses lasting 1/200 sec and even less. A brief description is given of equipment having an analogous purpose, developed at the Institut stroitel'noy mekhaniki AN UkrSSR (Institute of Structural Mechanics, Academy of Sciences, Ukrainian SSR).

members of scientific research institutes.

COVERAGE: The book deals with problems connected with the study of the stress state and the strength of machine and construction parts under nonstationary loads. Discussed are statistical methods of systematizing random alternating stress states, characteristics of experimental devices used for registering such stresses, and the recording of the results of fatigue tests. Attention is given to the analysis of stresses induced by short-duration forces in elastic machine systems. The book is the result of work carried out by the Institut mashinovedeniya (Institute of Machine Science) AN UkrSSR [now the Institut liteynogo proizvodstva] and of the processing of published data. V. A. Grobov, Doctor of Technical Sciences, is mentioned as having assisted in the editing of this book. Each chapter is accompanied by references, mostly Soviet.

AUTHORS: Buglov, Ye.G., Korsakevich, N.I.

TITLE: Equipment for the statistical processing of oscillograms.

SOURCE: Statisticheskiye voprosy prochnosti v mashinostroyenii.  
Ed. by S.V. Serensen. Moscow, Mashgiz, 1961, 30-39.

TEXT: The paper describes the design and performance of an equipment for the statistical processing of oscillograms, primarily those in which random variations in a quantity occur in the course of an otherwise stationary process, such as the stresses occurring in plows, traction couplings, harvester frames, etc. The new equipment is designed to process the 35-mm positive-film recordings made by the MHO-2 (MPO-2) oscillograph. Its basic principle is that of counting electric impulses obtained by means of a photoelectric element (cross-section and general-view photograph of equipment shown). The equipment comprises a light box, a film guide, a diaphragm with a single pin hole, and a photoelement. The diaphragm is placed and temporarily fastened at a specified distance from the zero line of the film recording. The film is then advanced in its guide underneath the diaphragm. Each time the black recording curve passes underneath the pinhole, the light passing through the pinhole suffers an interruption or weakening, and the resulting voltage pulse at the output of the photoelement is communicated to a counter. Repetition

Card 1/3

Equipment for the statistical processing of oscillograms. S/766/61/000/000/002/003

of the procedure at various distances of the pinhole from the zero line provides a set of source data for the determination of the statistical distribution curves. Maximal loads, which may or may not have occurred during a given experiment of finite duration, are obtained from an extrapolational completion of the actually observed distribution curves. The cyclic properties of the operational stresses, required for fatigue calculations, can be obtained from the same data by determining the number of extremal values contained between two neighboring levels from the difference in the respective counts at the two levels. Thus the basic extremal-recurrence data for fatigue calculations are obtained either from these differences or from the derivatives of the frequency-distribution curve. The mean-square deviation and the variance, in processes approximating a normal distribution, are obtained from the actually observed frequency distribution normalized by reduction of the frequencies to a percentage of the total number of observations made. The circuitry of the HC-64 (PS-64) counting device for the registration of the photo-element-output impulses is described and depicted, including provisions for an enhancement of the sensitivity and resolution of the device with simultaneous protection against spurious signals. Possible sources of errors are: (a) Excess count attributable to scratches, dirt, and dark spots on the film; (b) failure to record one of two closely spaced pulses, attributable to the inertia of the electronic device; (c) missed recordings attributable to low impulse voltage due to excessively slow

Card 2/3

Equipment for the statistical processing of oscillograms. .S/756/61/000/000/002/002

moving the film through the guide; (d) indeterminacy due to a near-horizontal character of portions of the recording. The effects of these sources have been experimentally measured and are reported. It is submitted that the resolving ability of the equipment is favored most effectively by stretching the time scale of the film recording. The following requirements should be fulfilled by oscillograms: (1) the recording should comprise a band not less than 7-8 mm wide; (2) the recording line should be photographically dense with a minimal thickness (evenly distributed) significantly smaller than the diameter of the pinhole; (3) the film should be scratch-free and, preferably, fog-free; (4) various recordings on an oscillogram should not overlap. The objectivity of the device is self-evident; its productivity is illustrated by an example in which one man-day was sufficient to obtain statistical information recorded on 40 m of film picturing the stresses in the frame of a ZIL-150 (ZIL-150) automobile during 12 km of travel (a task in which more than 350,000 individual counts had to be taken). There are 12 figures and 4 Russian-language Soviet references.

TOPIC TAGS: test facility, fatigue test, impact test, electric measuring instrument

ABSTRACT: This Author's Certificate introduces a fatigue testing installation which contains an electromagnet with an armature, a block on which this armature acts and a specimen holder. Test productivity is increased and impact duration is controlled by mounting the armature on an elastic suspension and connecting the electromagnet to a source of alternating current with a frequency equal to that of the mechanical system formed by the mass of the armature and the rigidity of the suspension. A flat spring connects the armature to the striking block.

TITLE: The Great Way (Bol'shoi put')

PERIODICAL: Ogneupory, 1957, Nr 10, pp. 438-446 (USSR)

ABSTRACT: The quantitative increase of the production of refractories in the USSR is shown by table 1; at present the requirements of the country are being fully satisfied. The increase of production was attained by building new plants as well as by the reorganization of already existing ones. A special scientific organization was created for the designing and planning of such new plants. Together with the building of new plants the technical reorganization of existing ones aims at an increase of production figures. The raw material basis was considerably increased by the discovery of new occurrences. During the last war production in the Eastern parts of the country was considerably increased. The geographical distribution of this production may be seen from table 2. The production of ladle bricks is carried out almost entirely by the method of half-dry pressing. Much has been achieved in the field of the mechanization of forming: the most complicated products are made on presses. Tables 3, 4, 5 and 6 contain data which characterize the change of the equipment of factories. For the development of the production of

Card 1/2

The Great Way

131-10-2/6

refractories the research work carried out by the scientific research institutes of Khar'kov and Leningrad proved very useful. Much attention ought to be paid to the building of new factories or factories under reconstruction in the East, in Siberia, Kazakhstan, and the Ural, because these areas still depend on supplies from other parts of the country. A further increase of the working capacity of workmen is considered to be one of the most important tasks, and for this purpose a further modernization of equipment and mechanization of production is intended to serve. There are 6 tables.

AUTHOR: Kordonskiy, Kh. B.; Korsakov, B. Ye.

TITLE: Calculation of the lifetime under fatigue utilizing the methods of the theory of probability

CITED SOURCE: Tr. Rizhsk. in-ta inzh. grazhd. vozd. flota, vy\*p. 5, 1961, 38 str.

TOPIC TAGS: fatigue, fatigue lifetime, fatigue probability

TRANSLATION: The authors note that the calculations of the lifetime under fatigue must be based on the distribution law of the lifetimes satisfying the following requirements: 1) the experimental distributions must agree well with the theoretical ones; 2) the stochastic model should not diverge from the observed phenomena: the damping of the changes within the material after a certain number of completed cycles, the effect of aging, and the increase in  $D(\ln N)$  during the decrease in  $\sigma_{max}$ . These requirements are satisfied by the hypothesis about the logarithmically normal distribution of lifetimes. In certain load cases when  $\sigma_{max}$  is small, the distribution deviates from the logarithmically normal one. It appears that such

Card 1/2

ACCESSION NR: AR4014428

a deviation can be explained by changes in the physical nature of the fatigue-induced breakdown.

The qualitative agreement of the theoretical curves and those actually observed raises hopes that it is possible to develop fully accurate methods for the calculation of lifetimes for the case of random loads. The authors point out that the mathematical solution of such a problem leads to the study of qualitatively new problems of random straying. (From the authors' summary.)

TITLE: Applications of the logarithmically-normal distribution to fatigue life calculations and tests

SOURCE: IVUZ. Aviatzionnaya tekhnika / no. 1, 1964, 145-152

TOPIC TAGS: fatigue, fatigue life, fatigue strength, fatigue accumulation, wear accumulation, hardening, hysteresis loop, stress, stress load, failure, failure detection, fatigue fault

ABSTRACT: Pointing out that it has been demonstrated that the logarithmically-normal distribution of fatigue life can be successfully used for the elaboration of experimental data, the authors note that the application of this law of distribution to the investigation of fatigue life is as yet unclear. Fatigue accumulation may be considered, in the opinion of the authors, as a particular instance of wear accumulation at the occurrence of hardening, manifested in the gradual reduction of the rate of wear. The existence of hardening is directly confirmed in the form of the change in the hysteresis loop in the transition from cycle to cycle. Moreover, there is an indirect proof in the presence of the

Card 1/4

ACCESSION NR: AP4033051

phenomenon of training, consisting in the reciprocal effect of stress levels on sum longevity. At low stresses, hardening occurs more slowly than under large loads, but more rapidly than the accumulation of fatigue faults. The effect of a small number of large loads is explained by the authors in terms of the high rate of hardening which corresponds to these stresses, and the point is made that with the application of a small number of large loads, the probability of the development of a serious fatigue fault is small, while at the same time there occurs intensive hardening. This, in turn, makes it possible to increase longevity within a wide range of loads. Discussing a continuous system of fatigue fault accumulation, the authors note that the most general phenomenological description of fatigue accumulation may be represented in the form of an integral:

$$d(t) = \int_0^t \xi(x) dx \quad (1)$$

with the assumption that the rate of fatigue accumulation  $\xi(t)$  is a random process which depends on the active cyclic load and that failure occurs when the value  $d(t)$  of the fatigue fault attains a certain level  $M$ . Lifetime distribution is determined entirely by the form of the process  $\xi(t)$ . The mathematical expectancy of the fatigue fault accumulation rate is shown to be:

$$E(\xi(t)) = \frac{G}{1+A} \quad (2)$$

Card 2/4

ACCESSION NR: AP4033051

This description, while admittedly extremely schematic, does provide a possibility of solving the very important problem of forcing (accelerating) fatigue lifetime tests. In the following sections of their discussion, the authors employ a discrete scheme of fatigue fault accumulation as the most convenient means from the point of view of computations, noting that it is possible, on the basis of the supposition of vigorous mixing present in the  $d(t)$  process, to replace the continuous process of fault accumulation with a discrete system for the same process. This means that at random moments of time, fatigue faults, identical in amplitude and character, arise, which are then gradually accumulated as the result of simple adding. Considering, in a further section, the condition of failure and the training effect, the authors derive a formula, on the basis of which it is possible to calculate the training effect and which provides an analytical relationship between the number of preliminary stress cycles and the number of cycles of the lifetime remnant at a specific control stress level. This is of great practical value, since fatigue tests are very time-consuming, particularly at low stress levels. The results outlined in the paper can be used to develop a method for carrying out accelerated (forced) fatigue tests designed for mean lifetime estimation. This method is described in the final section of the article. Orig. art. has: 3 figures and 19 formulas.

A microfiche card with a grid of frames. The top frame contains a title and a paragraph of text. The bottom frame contains a classification code and a list of numbers. The card is oriented vertically, with the title and text at the top and the classification code and list of numbers at the bottom. The card is labeled "BC" in the top left corner and "a-4" in the top right corner. The title is "Reduction of nitrate by bacteria: M. P. KORSAKOV (Russ. Microbiol. 1959, 9, 105-112)". The paragraph of text discusses the reduction of nitrate by bacteria, the theory of oxidation-reduction, and the role of the system donor of hydrogen (organic substances) and acceptor (oxygen). The classification code is "ASB-5.1.1 METALLURGICAL LITERATURE CLASSIFICATION". The list of numbers is "1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60 61 62 63 64 65 66 67 68 69 70 71 72 73 74 75 76 77 78 79 80 81 82 83 84 85 86 87 88 89 90 91 92 93 94 95 96 97 98 99 100 101 102 103 104 105 106 107 108 109 110 111 112 113 114 115 116 117 118 119 120 121 122 123 124 125 126 127 128 129 130 131 132 133 134 135 136 137 138 139 140 141 142 143 144 145 146 147 148 149 150 151 152 153 154 155 156 157 158 159 160 161 162 163 164 165 166 167 168 169 170 171 172 173 174 175 176 177 178 179 180 181 182 183 184 185 186 187 188 189 190 191 192 193 194 195 196 197 198 199 200 201 202 203 204 205 206 207 208 209 210 211 212 213 214 215 216 217 218 219 220 221 222 223 224 225 226 227 228 229 230 231 232 233 234 235 236 237 238 239 240 241 242 243 244 245 246 247 248 249 250 251 252 253 254 255 256 257 258 259 260 261 262 263 264 265 266 267 268 269 270 271 272 273 274 275 276 277 278 279 280 281 282 283 284 285 286 287 288 289 290 291 292 293 294 295 296 297 298 299 300 301 302 303 304 305 306 307 308 309 310 311 312 313 314 315 316 317 318 319 320 321 322 323 324 325 326 327 328 329 330 331 332 333 334 335 336 337 338 339 340 341 342 343 344 345 346 347 348 349 350 351 352 353 354 355 356 357 358 359 360 361 362 363 364 365 366 367 368 369 370 371 372 373 374 375 376 377 378 379 380 381 382 383 384 385 386 387 388 389 390 391 392 393 394 395 396 397 398 399 400 401 402 403 404 405 406 407 408 409 410 411 412 413 414 415 416 417 418 419 420 421 422 423 424 425 426 427 428 429 430 431 432 433 434 435 436 437 438 439 440 441 442 443 444 445 446 447 448 449 450 451 452 453 454 455 456 457 458 459 460 461 462 463 464 465 466 467 468 469 470 471 472 473 474 475 476 477 478 479 480 481 482 483 484 485 486 487 488 489 490 491 492 493 494 495 496 497 498 499 500 501 502 503 504 505 506 507 508 509 510 511 512 513 514 515 516 517 518 519 520 521 522 523 524 525 526 527 528 529 530 531 532 533 534 535 536 537 538 539 540 541 542 543 544 545 546 547 548 549 550 551 552 553 554 555 556 557 558 559 560 561 562 563 564 565 566 567 568 569 570 571 572 573 574 575 576 577 578 579 580 581 582 583 584 585 586 587 588 589 590 591 592 593 594 595 596 597 598 599 600 601 602 603 604 605 606 607 608 609 610 611 612 613 614 615 616 617 618 619 620 621 622 623 624 625 626 627 628 629 630 631 632 633 634 635 636 637 638 639 640 641 642 643 644 645 646 647 648 649 650 651 652 653 654 655 656 657 658 659 660 661 662 663 664 665 666 667 668 669 670 671 672 673 674 675 676 677 678 679 680 681 682 683 684 685 686 687 688 689 690 691 692 693 694 695 696 697 698 699 700 701 702 703 704 705 706 707 708 709 710 711 712 713 714 715 716 717 718 719 720 721 722 723 724 725 726 727 728 729 730 731 732 733 734 735 736 737 738 739 740 741 742 743 744 745 746 747 748 749 750 751 752 753 754 755 756 757 758 759 760 761 762 763 764 765 766 767 768 769 770 771 772 773 774 775 776 777 778 779 780 781 782 783 784 785 786 787 788 789 790 791 792 793 794 795 796 797 798 799 800 801 802 803 804 805 806 807 808 809 810 811 812 813 814 815 816 817 818 819 820 821 822 823 824 825 826 827 828 829 830 831 832 833 834 835 836 837 838 839 840 841 842 843 844 845 846 847 848 849 850 851 852 853 854 855 856 857 858 859 860 861 862 863 864 865 866 867 868 869 870 871 872 873 874 875 876 877 878 879 880 881 882 883 884 885 886 887 888 889 890 891 892 893 894 895 896 897 898 899 900 901 902 903 904 905 906 907 908 909 910 911 912 913 914 915 916 917 918 919 920 921 922 923 924 925 926 927 928 929 930 931 932 933 934 935 936 937 938 939 940 941 942 943 944 945 946 947 948 949 950 951 952 953 954 955 956 957 958 959 960 961 962 963 964 965 966 967 968 969 970 971 972 973 974 975 976 977 978 979 980 981 982 983 984 985 98

The products for under aerobic conditions are the final products, and a being, for *E. coli*, lactic, acetic, and succinic acids, which cannot be fermented further, as they cannot be activated. Under aerobic conditions, however, lactic and succinic acids form, with the oxygen, whereas which *E. coli* is able to activate. When nitrogen is present in solution as pyruvate acid, acetic acid, *E. coli* produces more acids, also under anaerobic conditions, than under aerobic conditions. Quastel and Woodhouse, *J. Biol. Chem.* 1950. The general conclusion reached from the available data is that the reduction of nitrogen by bacteria represents an oxidative-reduction process, conditioned by the difference of potential which depends on the mutual relationships between the bacteria and the medium, and may change with alteration of such relationships.

alkylphenol additive, oil, petroleum, lubricant, engine oil, motor oil

ABSTRACT: The purpose of this work is to find a better substitute for benzene sulfonic acid as a catalyst for the alkylation of phenol. This work was done at the Moskovskiy institut neftekhimicheskogo (Moscow Institute of Petro-chemical and Gas Industry) under the direction of Prof. V. I. Isagulyants. Phenol was alkylated by olefins in the presence of KU-2 cation exchange resin which is a sulfonated copolymer of styrene and divinylbenzene having a functional  $\text{SO}_3\text{H}$  group. This is a heterogeneous catalyst which, unlike benzene sulfonic acid (BSA), does not require washing of the product, there being no phenol contamination of wash water; the

TITLE: A hydrological unit for operations under ice. Class 42, No. 183412 [announced by the Arctic and Antarctic Scientific Research Institute (Arkticheskiy i Antarkticheskiy nauchno-issledovatel'skiy institut)]

SOURCE: Izobreteniya, promyshlennyye obraztsey, tovarnyye znaki, no. 13, 1966, 83-84

TOPIC TAGS: sea ice, hydrologic instrument, marine equipment

ABSTRACT: This Author's Certificate introduces: 1. A hydrologic unit for operations under ice. The installation contains hydroacoustic transmitting equipment mounted on a ship and a submarine unit consisting of hydroacoustic receiving equipment placed within an instrument buoy connected to an anchor cable which holds the automatic recording equipment at the level being studied. To improve reliability in using this floating equipment under icy conditions, the hydroacoustic transmitting apparatus is equipped with a modulator and a coding unit connected in the pulse generator circuit, while the receiving equipment has two code frequency filters and a logical coincidence circuit connected to the actuating mechanism which releases the buoy. 2. modification of this unit in which a calendar clock mechanism is used for switching on the power supply according to a given program. 3. A modification of this unit in which location of the buoy after surfacing is facilitated by providing a radio transmitter with an antenna which is automatically raised, and a smoke marker.
